EMERGENCY ADMINISTRATION OF EPINEPHRINE

TRAINING STANDARDS FOR THE ADMINISTRATION OF EPINEPHRINE VIA AUTO INJECTORS

A growing number of students enrolled in New Jersey schools have potentially life threatening allergies. Law requires the development of district policy appropriate to address the needs of these students and in the creation of a safe environment for students with life threatening allergies. This document incorporates the standards for the administration of epinephrine via auto-injectors in accordance with New Jersey P.L. 2007, c. 57. These standards are intended to provide guidelines for training school personnel who have volunteered to serve as school nurse designees and receive such training. In 2007, the New Jersey legislature amended N.J.S.A. 18A:40-12.3-12.6 adding provisions that address the administration of epinephrine to students in New Jersey schools. The law requires the Audubon Board of Education to:

- Develop a policy for the emergency administration of epinephrine via a pre-filled auto injector. (The policy must delineate the provision of services to all students who require the administration of epinephrine for anaphylaxis).

- Ensure the availability of trained designees for any student who may require the emergency administration of epinephrine by pre-filled auto-injector when the certified school nurse is not available.

- Store epinephrine in a secure but unlocked location easily accessible to the certified school nurse and designee(s), to ensure prompt availability in the event of an allergic reaction at school or a school sponsored function.

- Ensure the availability of the certified school nurse or designee(s) on site at the school and at school sponsored functions in the event of an allergic reaction.

- Ensure the transportation of the student to a hospital emergency room by emergency services personnel after the administration of epinephrine.

- Establish and disseminate guidelines for the development of a policy for the management of food allergies in the school setting and the emergency administration of epinephrine to students.

- Have training protocols to assist the school nurse in recruiting and training additional school employees as volunteer designees.

Definition of Terms

1. Anaphylaxis - A serious allergic reaction that is rapid in onset and may cause death.
Definition of Terms (continued)

2. Auto-injector - A pre-measured, spring-loaded pen-like device used to administer epinephrine and designed for ease of use by non-medical persons.

3. Certified School Nurse - A person who holds a current license as a registered professional nurse from the State Board of Nursing and an Educational Services Endorsement, school nurse school nurse/non-instructional from the Department of Education pursuant to N.J.A.C. 6A:9 13.3 and 13.4.

4. Delegation - Transferring to a competent individual the authority to perform a selected nursing task in a selected situation. The nurse retains accountability for the delegation.

5. Delegator – The person making the decision to delegate the administration of epinephrine.

6. Delegate/Designee - The person receiving designation to administer epinephrine.

7. Epinephrine (adrenaline) - A drug that can be successfully utilized to counteract anaphylaxis.

8. Individualized Emergency Healthcare Plan - A personalized healthcare plan written by the certified school nurse that specifies the delivery of accommodation and services needed by a student in the event of an emergency.

9. Individualized Healthcare Plan - A plan written by the certified school nurse that details accommodations and/or nursing services to be provided to a student because of the student’s medical condition based on medical orders written by a health care provider in the student’s medical home.

10. School-Sponsored Function - Any activity, event, or program occurring on or off school grounds, whether during or outside of regular school hours, that is organized/or supported by the school.

Training Standards for the Administration of Epinephrine via Auto Injectors

The school nurse is responsible for delegating the administration of epinephrine to school personnel in the event of an emergency. As such, the nurse must assess the competency of personnel to whom a task has been delegated. To do so, the school nurse must provide training for all school personnel responsible for the administration of epinephrine via an auto-injector in an emergency. This training must be provided at least annually and must include the information provided in this document.

Common Causes of anaphylaxis include
- Food (most commonly-peanuts, walnuts, pecans, fish, shellfish, eggs, milk, soy, and wheat)
- Medication
- Insect stings
- Latex
Less Common Causes of anaphylaxis include
- Exercise
- Food-dependent exercise-induced anaphylaxis (occurs when a person eats a specific food and exercises within three to four hours after eating)
- Idiopathic anaphylaxis (anaphylaxis with no apparent cause)

Recognizing Symptoms of Anaphylaxis

When a school nurse has recruited a delegate to administer epinephrine in an emergency, the nurse must then provide training to prepare the delegate for this responsibility. Part of the training should include a review of the student’s Individualized Emergency Healthcare Plan (IEHP) so that the delegate will be aware of the symptoms that may trigger an allergic reaction in that specific student. The delegate must become familiar with recognizing the symptoms of allergic or anaphylactic reactions and triggers that cause these reactions for each student as delineated in the medical orders of the student’s medical home.

Examples of symptoms that may occur during an allergic reaction/anaphylaxis:
(severity of symptoms can change quickly)
- **Mouth**: Itching, tingling, or swelling of lips, tongue, and mouth
- **Skin**: Hives, itchy rash, swelling on the face or extremities
- **Gut**: Nausea, abdominal cramps, vomiting, diarrhea
- **General**: Panic, sudden fatigue, chills, feeling of impending doom

Examples of potentially life-threatening symptoms that may occur:
- **Throat**: Tightening of throat, hoarseness, hacking cough
- **Lung**: Shortness of breath, repetitive coughing, wheezing
- **Heart**: THREADY pulse, passing out, fainting, paleness, blueness

(If reaction is progressing, several of the above body systems may be affected.)

*Note: While skin symptoms such as itching and hives occur in the majority of food allergic reactions anaphylaxis does not require the presence of such skin symptoms. The most dangerous symptoms include breathing difficulties and a drop in blood pressure, causing shock, and are manifested by symptoms like, pallor, dizziness, faintness or passing out.*

Anaphylaxis is likely when any ONE of the criteria below is fulfilled:

1. Acute onset of an illness (symptoms may begin within several minutes to two hours after exposure to the allergen) with involvement of skin/mucosal tissue, such as:
   - Hives,
   - Generalized itch/flush, or
   - Swollen lips/tongue/uvula,
Airway compromise, such as:
- Dyspnea (trouble getting air),
- Wheeze/bronchospasm, or
- Stridor (high-pitched breathing noises).

Reduced blood pressure or associated symptoms, such as:
- Hypotonia (decreased muscle tone),
- Syncope (fainting),
- Pallor, dizziness, or
- Blue, weak pulse

2. Two or more of the following after exposure to suspected or known allergen for that patient
(symptoms may begin within several minutes to two hours after exposure to the allergen)
- Skin/mucosal tissue, e.g., hives, generalized itch/flush, swollen lips/tongue/uvula;
- Airway compromise, e.g., dyspnea (trouble getting air), wheeze/bronchospasm, stridor (high-pitched breathing noises);
- Associated symptoms, e.g., hypotonia (decreased muscle tone), syncope (faint); or
- Gastrointestinal symptoms, e.g., crampy abdominal pain, vomiting.

3. Hypotension after exposure to known allergen for that patient (symptoms may begin within several minutes to two hours after exposure to the allergen)
- Infants and children: low systolic BP (age-specific) or >30% drop in systolic BP,* or
- Adults: systolic BP, 100 mm Hg or >30% drop from their baseline.

Note: Some individuals have an anaphylactic reaction, and the symptoms go away only to return a few hours later. This is called a bi-phasic reaction. Often the symptoms of the bi-phasic reaction occur in the respiratory system and take the individual by surprise. Therefore, according to the American Academy of Allergy, Asthma, and Immunology (AAAAI), after a serious reaction “observation in a hospital setting is necessary for at least four hours after initial symptoms subside because delayed and prolonged reactions may occur even after proper initial treatment.” (AAAAI, Position Statement, Anaphylaxis in schools, and other child-care setting)

*Delegates are not expected to measure and determine a rate of drop in blood pressure as part of epinephrine administration training.

Training Standards for the Administration of Epinephrine via Auto Injectors (continued)

Standards and Procedures for the Emergency use of Epinephrine Auto-Injector

An epinephrine auto-injector is a disposable drug delivery device that is easily transportable (about the size of a magic marker) and contains a pre-measured dose of epinephrine. The auto-injector is designed to treat a single anaphylactic episode; and the device must be properly discarded (in compliance with applicable state and federal laws) after its use. It is the responsibility of the parent(s) to provide prescribed epinephrine to the school nurse. As a rule, each student should have two epinephrine auto-injectors available in case subsequent doses of epinephrine are needed to counter a severe reaction.

Steps in the Emergency Use of an Epinephrine Auto-Injector:

1. Determine if anaphylaxis is reasonably suspected based on the symptoms identified in the student’s IEHP. If there is a reasonable probability that anaphylaxis is occurring or about to occur, then treat the situation like an anaphylactic emergency.

2. Do not leave the student alone. Call 911 and then follow the district’s policies and procedures for medical emergencies. Paramedics, the school nurse, the student’s parents, and appropriate school administrator(s) should be notified immediately.

3. Most severe allergic reactions in children primarily involve trouble breathing. Children will likely need to sit calmly and upright as they are treated for their breathing problems. However:
   
   A. If there is evidence of faintness, loss of consciousness or confusion, lay the child flat. If a child is very ill and needs to be treated in a lying position with legs raised, they should stay in that position, if possible, during transportation to a hospital. Do not change to an upright position, except
   
   B. If the child is vomiting, do not lay the child flat. If the child is hypotensive and vomiting, then he/she should be put down on his/her side, so that the child does not choke on the vomit.

4. Prepare to administer auto-injectable epinephrine, as indicated by the student’s health care provider (physician, advanced practice nurse, or physician’s assistant) on the IEHP.
   
   A. Have the student sit down,
   
   B. Reassure the student and avoid moving him or her, and
   
   C. Check the auto-injector for expiration date and color (to be effective, the solution in the auto-injector should be clear and colorless)

5. Epinephrine Auto-injector Administration Procedure:
   
   A. Grasp the auto-injector in one hand and form a fist around the unit. With the other hand, pull off the safety cap. (To avoid injecting yourself after removing the cap(s), never place your own fingers or hand over either end of the device. If you accidentally inject yourself, and then use the back-up auto-injector to treat the student. You should go to the hospital emergency room as well.)
Training Standards for the Administration of Epinephrine via Auto Injectors (continued)

B. Hold the tip of the auto-injector near the student's outer thigh. (The auto-injector can be injected through the student's clothing, if necessary.)

C. Press firmly and hold the tip into the OUTER THIGH so that the auto-injector is perpendicular (at a 90° angle) to the thigh. You may hear a click.

D. Hold the auto-injector firmly in place for 10-15 seconds. (After the injection, the student may feel his or her heart pounding. This is a normal reaction.)

E. Remove the auto-injector from the thigh and massage the injection area for several seconds.

F. Check the tip. If the needle is exposed, the dose has been delivered. If the needle is not exposed, repeat steps b through e.

G. Dispose of the auto-injector in a "sharps" container or give the expended auto-injector to the paramedics.

H. Call 911, if not previously called.

J. Call for the school nurse, if not previously called.

6. If the anaphylactic reaction is due to an insect sting, remove the stinger (if there is one) as soon as possible after administering the auto-injector. Remove the stinger quickly by scraping with a fingernail, plastic card, or piece of cardboard. Apply an ice pack to the sting area. Do NOT push, pinch, or squeeze, or further imbed the stinger into the skin because such action may cause more venom to be injected into the student.

7. Observe the student. In some circumstances a second administration of epinephrine may be necessary. The school nurse, who is responsible for delegating the administration of epinephrine, must determine that the delegate is competent to administer a second dose of epinephrine in accordance with the written orders from the medical home, the policies and procedures of the district or nonpublic school and the circumstances involved in the emergency.

8. Monitor the student's airway and breathing. If trained in CPR, begin CPR immediately if the student stops breathing.

9. Give a copy of the IEHP to the emergency responders. When emergency responders arrive, tell them the time epinephrine was administered and the dose administered. If the auto-injector has not been disposed of in a sharps container, give the expended auto-injector to the paramedics.

Note: Any student who receives epinephrine should be transported to a hospital emergency room, even if symptoms appear to have subsided. If ordered by a health care provider, send a spare auto-injector along with the student to the hospital. A staff member should accompany the child to the hospital and follow procedures in accordance with the district policies regarding the care of students during emergencies.

10. The school nurse should document the incident on the student's health record.
    • An order for antihistamine administered concurrently with epinephrine does not preclude the emergency administration of epinephrine; however, the antihistamine cannot be given by the delegate even if specified in the IEHP because the statute at N.J.S.A. 18A:40-12.6 only authorizes the delegation of epinephrine.
Training Standards for the Administration of Epinephrine via Auto Injectors (continued)

- Medical orders that impose a required observation period between administration of an antihistamine and epinephrine are not recommended, in general, and cannot be delegated.

Storage of Epinephrine Auto-Injectors

Epinephrine auto-injectors should be stored at room temperature until the marked expiration date, at which time the unit must be replaced. Auto-injectors should not be refrigerated as this could cause the device to malfunction. Auto-injectors should not be exposed to extreme heat (such as in the glove compartment or trunk of a car during the summer) or to direct sunlight. Heat and light shorten the life of the product and can cause the epinephrine to degrade. To be effective, the solution in the auto-injector should be clear and colorless.

P.L. 2007, c. 57 requires that epinephrine auto-injectors be kept in unlocked secure locations to be readily available during an emergency. This will vary depending upon the student’s schedule and the circumstances surrounding the possible emergency. In addition to the nurse’s office, possible locations for unlocked secure storage of epinephrine include the principal’s office, the cafeteria, a classroom, the teacher’s room, on the person of the designee, etc. Availability of epinephrine should be addressed in the IEHP and during the training of the designee by the school nurse.

P.L. 2007, c. 57 requires that epinephrine auto-injectors be kept in unlocked secure locations to be readily available during an emergency. This will vary depending upon the student’s schedule and the circumstances surrounding the possible emergency. In addition to the nurse’s office, possible locations for unlocked secure storage of epinephrine include the principal’s office, the cafeteria, a classroom, the teacher’s room, on the person of the designee, etc. Availability of epinephrine should be addressed in the IEHP and during the training of the designee by the school nurse.

REMINDER: Epinephrine is medication held by the school through the authorization of a health care provider’s order. Only school nurses, designees, or students, able to self-medicate, should have epinephrine auto-injectors on their person.

EMERGENCY FOLLOW-UP PROCEDURES

After epinephrine has been administered, emergency medical care MUST be obtained immediately because severely allergic students who have experienced anaphylaxis may need emergency respiratory care, cardiac care, or even resuscitation if they stop breathing. At a minimum, these students will need professional care to determine whether additional epinephrine, steroids, antihistamines, or other treatment is required. Follow-up diagnosis and care by health care professionals after the administration of epinephrine is important for recovery. A delayed or secondary reaction may occur. Therefore, the student needs to remain under medical supervision for at least four hours after an episode of anaphylaxis.

POLICIES AND PROCEDURES

It is strongly recommended but not required that school personnel volunteering to be trained to administer auto-injectable epinephrine also receive instruction and maintain current certification in cardiopulmonary resuscitation from a recognized provider such as the American Red Cross or the American Heart Association.

Statutory Requirements

N.J.S.A. 18A:40-12.6b and c require district boards of education or chief school administrators of nonpublic schools to implement guidelines and recruit and train volunteers.
Training Standards for the Administration of Epinephrine via Auto Injectors (continued)

N.J.S.A. 18A:40-12.5 requires district boards of education or chief school administrators of nonpublic schools to develop a policy for the emergency administration of epinephrine.

District Board of Education Policies

N.J.A.C. 6A:16-1.4(a)1 requires district boards of education to develop and adopt written policies, procedures, mechanisms or programs governing the care of any student who becomes injured or ill while at school or during participation in school-sponsored activities.

N.J.A.C. 6A:16-1.4(a)2 requires district boards of education to develop and adopt written policies, procedures, mechanisms or programs governing the transportation and supervision of any student determined to be in need of immediate medical care.

N.J.A.C. 6A:16-1.4(a)7 requires district boards of education to develop and adopt written policies, procedures, mechanisms or programs governing the emergency administration of epinephrine to a student for anaphylaxis pursuant to N.J.S.A. 18A:40-12.5.

N.J.A.C. 6A:16-2.1(a)2iv requires district boards of education to develop and adopt written policies, procedures and mechanisms for the provision of health, safety and medical emergency services and ensure that staff are informed, as appropriate, regarding the administration of medication, including school employees trained and designated by the school nurse to administer epinephrine in an emergency pursuant to N.J.S.A. 18A:40-12.5 and 12.6;

N.J.A.C. 6A:16-2.1(a)4i requires district boards of education to develop and adopt written policies, procedures and mechanisms for the provision of health, safety and medical emergency services and ensure staff are informed as appropriate regarding the provision of health services in emergency situations including the emergency administration of epinephrine pursuant to N.J.S.A. 18A:40-12.5.

N.J.A.C. 6A:7-1.4 requires boards of education shall adopt and implement written educational equity policies that promote equal educational opportunity and foster a learning environment that is free from all forms of prejudice, discrimination and harassment based upon race, creed, color, national origin, ancestry, age, marital status, affectional or sexual orientation, gender, religion, disability or socioeconomic status in the policies, programs and practices of the district board of education.

2. RECRUITING DELEGATES FOR THE MANAGEMENT OF ANAPHYLAXIS IN THE SCHOOL SETTING

New Jersey boards of education or nonpublic school administrators, school nurses, administrators, and staff should work as a team with parents/guardians and the student at risk of anaphylaxis to promote the health, safety, and welfare of students.

New Jersey law requires local boards of education and nonpublic school administrators to develop a policy for the emergency administration of epinephrine for anaphylaxis. This policy should be just one of several policies created by the district or nonpublic school regarding the provision of health, safety, and medical emergency services.
Training Standards for the Administration of Epinephrine via Auto Injectors (continued)

The administration of medication in the school setting is the responsibility of the school nurse; however, New Jersey law requires that, as part of emergency planning, additional volunteers be trained to administer epinephrine in the absence of the school nurse. The law also protects the district, the nonpublic school administrator, the school nurse, and the delegate from liability.

The Role of the Parent or Guardian

1. The parent(s)/guardian(s) must provide the school with written statement from their physician or advanced practice nurse that the pupil’s allergies may require the administration of epinephrine for anaphylaxis.

2. Provide physician’s medication order, directions, and consent for administration with the understanding that the district shall have no liability as a result of any injury arising from the administration of a pre-filled, single dose auto injector mechanism containing epinephrine.

3. Provide properly labeled medication(s) and promptly replace medication after use or upon expiration. 2 units Epinephrine via Auto-Injector must be provided; one will be kept in the Health Office and the other will be kept in an unlocked, secure location as per N.J.S.A. 18A 40-12.6.

4. Educate the child in the self-management of their food allergy including:
   - safe and unsafe foods;
   - strategies for avoiding exposure to unsafe foods;
   - symptoms of allergic reactions;
   - how and when to tell an adult they may be having an allergy-related problem; and
   - how to read food labels (age appropriate)

5. Work with the school team, as per student needs, to develop a plan that accommodates the student throughout the school, including the classroom, K.E.Y.S. program, and school sponsored activities.

6. It is understood that the parents/guardians have the responsibility to inform the school nurse in a timely manner of the school sponsored events in which their child will participate and in which the parent is not in attendance.

7. Provide current emergency contact information and update regularly.

The Role of School Board and Administrators

1. Develop requisite polices and procedures outlined in Section IV-Policies and Procedures.

2. Recruitment of delegates requires administrators and school nurses to work collaboratively. There is both an individual and organizational accountability for delegation.

3. Administrators should assist the school nurse in creating circumstances favorable for delegation to occur. These include:
Training Standards for the Administration of Epinephrine via Auto Injectors (continued)

- providing sufficient resources (for example, emergency communication devices, adequate training programs, professional development hours, and financial reimbursement for time committed to training and attendance at school functions),
- providing opportunity for continuing professional development, including adequate and tangible training for both nurses and staff, and
- creating an environment conducive to teamwork, collaboration, and student-centered care.

The Roles of the School Nurse

2. New Jersey law specifically recognizes the administration of an epinephrine auto-injector in the school setting as a delegable task by the school nurse. This includes delegation of the auto-injector portion of the Twinject. The nurse must determine that the task, the circumstances, the directions, and supervision are appropriate, and that the risks associated with delegation are minimized. Some considerations for selecting the appropriate delegate include:

   - Select a responsible employee who will be reasonably available to the student, particularly where and when anaphylaxis is most likely to occur
   - Consider the knowledge and skills of the individual(s) to whom care may be delegated, and remember that their competency will be enhanced by specific training.
   - Consider the proximity and availability of the potential delegate, given the location(s) of the student throughout the school day, the size of the school, and after-hours and off-site school-sponsored functions.
   - A student should be assigned as many delegates as necessary to ensure complete back-up coverage, and
   - A staff member can serve as a delegate to more than one student, provided he/she has received specific information about each student.

3. A potential delegate is more likely to accept the delegation willingly if the school nurse explains the process with confidence and has approached the candidate thoughtfully. Initial reluctance may be overcome by providing information and reassurance.
Training Standards for the Administration of Epinephrine via Auto Injectors (continued)

4. The school nurse should be proactive in recruiting volunteers that may be appropriate candidates. This means identifying and approaching the candidate, describing the delegation process, and asking, though not compelling, the candidate to accept the delegation.

5. The school nurse provides training to the delegate that includes written instructions and a review of the Student’s Individual Emergency Healthcare Plan.

6. The school nurse plans the delegation, based on the student’s needs and available resources. The nurse provides periodic and regular evaluation and monitoring of the delegate to ensure an appropriate delegation has been made.

7. The school nurse is responsible for documenting the training of each delegate for each student annually, communicating regularly with delegates and updating the Individualized Emergency Healthcare Plan of any student with life-threatening allergies.

8. The law protects the district, the school nurse, and the delegate from liability.

The Role of the Delegate

The delegate is part of a team whose goal is to provide the best care for students while at school and school-sponsored functions.

1. Delegates serve as a member of the team. A team approach to severe allergy/possible anaphylaxis management is vital i.e., school staff, students, parents, and health care providers should work together to minimize risks and provide a safe educational environment for allergic students.

2. Delegates will participate in training sessions provided by the school nurse that provide clear expectations regarding what to do, what to report, and how to ask for assistance.

3. Delegates will review written instructions from the school nurse and the Individualized Emergency Healthcare Plan including all unique student requirements and characteristics.

4. Delegates will administer epinephrine only in an emergency, when the symptoms described during delegate training are present and the nurse is unavailable.

5. Delegates will ask questions and seek clarification at any time before, during, or after training. Communication is a two-way process and is essential to the provision of services to students during emergencies.

6. Delegates may need to assist students who are permitted to carry and self-administer epinephrine before, during, or after the administration of epinephrine. These students are also entitled to a delegate when unable to self-administer their own, epinephrine.

7. The law protects the district, the school nurse, and the delegate from liability.
Training Standards for the Administration of Epinephrine via Auto Injectors (continued)

8. Delegates should be familiar with the following information:

- Allergies can be life-threatening. Exposure to offending allergens can result in anaphylaxis. Anaphylaxis, however, is preventable by strict avoidance of offending allergens and treatable by auto-injection of epinephrine (adrenaline) along with medical intervention.

- Epinephrine is most effective for controlling severe allergic reactions in children.

- Through appropriate risk-reduction and allergen-avoidance procedures, the likelihood of the need for epinephrine administration can be minimized.

- Epinephrine is administered in the school setting by auto-injector. An auto-injector is a pre-measured, spring-loaded pen-like device designed for ease of use by non-medical persons in the community. No needle is even visible until the administration is complete.

- The epinephrine auto-injector will be stored in secure and unlocked locations so that it can be readily available for use by the delegate in the event of an emergency. The location of the epinephrine auto-injector will be documented on the IEHP.

Adopted: October 21, 2009
AUDUBON SCHOOL DISTRICT

HEALTHCARE PROVIDER’S ORDERS FOR ALLERGY EMERGENCY TREATMENT

Student’s Name______________________________Grade/Teacher/HmRm _______________

The above student is allergic to:

Symptoms of allergic response/reaction:
____________________________________________________________________________

This student has a history of an anaphylactic reaction: ____no ____yes
If yes, date of reaction _______ Treatment provided ____________________________
Facility _______ER _______Out Patient _______Hospital

Asthmatic  □ Yes □ No

PLEASE NOTE: The School Nurse by law may administer any medication with health care provider’s orders and parental consent, but trained non-medical designees, who may give emergency treatment in the School Nurse’s absence, are NOT permitted by law to administer any medications other than epinephrine via auto-injector mechanism.

MEDICATION TO BE GIVEN FIRST:

□ EpiPen (0.3 mg)  □ EpiPen Jr.
(0.15mg)

□ Antihistamine (specify) ____________________________  □ Other (specify)

DOSAGE AND ROUTE OF ADMINISTRATION
____________________________________________________________________________

POSSIBLE SIDE EFFECTS
____________________________________________________________________________

OTHER INSTRUCTIONS
____________________________________________________________________________

Give medication for the following checked symptoms:

□ Contact with allergen, but no symptoms
□ Skin – hives, itchy rash, extremity swelling
□ Lips – itching, tingling, burning, or swelling of lips
□ Head/neck – swelling of tongue, mouth, or throat, hoarseness, hacking cough, tightening of throat
□ Gut – abdominal cramps, nausea, vomiting, diarrhea
□ Lungs – repetitive cough, wheezing, shortness of breath
□ Heart – thready pulse, low blood pressure, fainting, pale or bluish skin

MEDICATION TO BE GIVEN SECOND:

□ EpiPen (0.3 mg)
(0.15mg)  □ EpiPen Jr.
☐ Antihistamine (specify) ___________________________________________ ☐ Other (specify) ___________________________________________

DOSAGE AND ROUTE OF ADMINISTRATION

POSSIBLE SIDE EFFECTS

OTHER INSTRUCTIONS

Give medication for the following checked symptoms:

☐ Contact with allergen, but no symptoms
☐ Skin – hives, itchy rash, extremity swelling
☐ Lips – itching, tingling, burning, or swelling of lips
☐ Head/neck – swelling of tongue, mouth, or throat, hoarseness, hacking cough, tightening of throat
☐ Gut – abdominal cramps, nausea, vomiting, diarrhea
☐ Lungs – repetitive cough, wheezing, shortness of breath
☐ Heart – thready pulse, low blood pressure, fainting, pale or bluish skin

☐ This student has been instructed in proper administration of single dose units of the medication(s) named above and is competent to self administer
☐ This student is not capable or authorized to self-administer single dose unit of the medication(s) named above.

Healthcare Provider’s signature ________________________________

Healthcare Provider’s phone # ________________________________

Date _____________________ Healthcare Provider’s Stamp
AUDUBON SCHOOL DISTRICT
PARENT/GUARDIAN CONSENT FOR ALLERGY EMERGENCY TREATMENT

My child, ___________________________, requires the administration of epinephrine in case of an anaphylactic reaction. I understand that I must submit to the School Nurse written orders from a healthcare provider, indicating that my child requires the administration of the medication. I further understand that I must provide the school with 2 current epinephrine pre-filled auto-injectors, that I am responsible for replacing them when they expire or have been used, and that I shall pick them up at the end of the school year or the end of the period of medication. My permission is effective for the school year for which it is granted. I understand that it must be renewed for each subsequent school year.

I understand that the School Nurse will be available during school hours and may be available at school-sponsored events in case of an allergic reaction. The trained designee, if appointed, will be available during school hours and at school-sponsored events. I realize that it is my responsibility to inform the nurse in a timely manner of the school-sponsored events in which my child will participate. I further understand that designees may be assigned to students who are qualified to self-administer their emergency medications, as well as to those who are not qualified to self-administer. In the event that I decline to have a designee appointed, I also understand that there may not be a nurse at every school-sponsored event occurring outside the school day.

My child will self-administer a single dose unit of medication ONLY after a healthcare provider certifies that my child has a potentially life-threatening allergy, is capable of, and has been instructed in the proper method of self-administration, pursuant to N.J.S.A. 18A:40-12.3 and 12.4. Students permitted to carry and self administer their own epinephrine are also entitled to a delegate.

If my child should suffer an anaphylactic reaction and neither the school nurse nor the delegate is available, the emergency medical system will be activated by dialing 9-1-1.

Pursuant to N.J.S.A. 18A:40-12.5, I acknowledge my understanding that the Audubon School District, its employees and agents shall have no liability as a result of any injury arising from the administration of the epinephrine to my child, and I indemnify and hold harmless the district and its employees or agents against any claims arising out of the administration of the epinephrine to my child.

PARENTAL PERMISSION/AUTHORIZATION

☐ I grant permission and authorize the School Nurse to administer emergency medications as ordered by healthcare provider to treat my child for an allergic reaction or anaphylaxis.

Parent/Guardian Signature: __________________________________ Date: __________

PARENTAL PERMISSION/AUTHORIZATION FOR DELEGATE

☐ I authorize the School Nurse to designate and train one or more employees of the Audubon School District to administer epinephrine via pre-filled auto-injector.
mechanism to my child in case of emergency, when the School Nurse is not present. I understand that no other medications, such as antihistamines, may be administered by the designee, and that the epinephrine via pre-filled auto-injector mechanism will be administered by the designee according to the orders provided by my child’s Healthcare Provider.

☐ I DO NOT authorize the School Nurse to designate one or more employees of the Audubon School District to administer epinephrine via pre-filled-auto-injector mechanism to our child. We understand that a nurse may not be available during school-sponsored events.

Parent/Guardian Signature: __________________________________________

</tbody>
</table>

Inform 911 operator that Epi-Pen was given so paramedics can respond appropriately.
Nurse (and/or delegate if CPR Certified) will begin and continue CPR if absent breathing/pulse.
Contact parent/guardian,___________________________, at (______)__________________
or emergency contact person – if unavailable school personnel will accompany student to the hospital.
Call and inform Healthcare Provider,___________________________, at (______)__________________
Directions for use of Epi-Pen

- Pull off gray cap
- Place black tip against outer thigh, through clothing if necessary
- Press firmly until you hear a click
- Hold in place for 10 seconds, then remove
- Massage Injection site for 10 seconds
- Do not return Epi Pen to holder after use, give to EMS personnel or discard in sharps container
